

Types of Science Projects:

There are two types of science projects: Models and Experiments. Here is the difference between the two:

BORING !!!!!
DON'T DO THIS.....

A Model, Display or Collection:

Shows how something works in the real world, but doesn't really test anything

Examples of display or collection projects can be: "The Solar System", "Types of Dinosaurs", "Types of Rocks", "My gum collection..." Examples of models might be: "The solar system" or "How an Electric Motor Works", "Tornado in a Bottle"

COOL!!!! DO THIS

An Experiment:

Lots of information is given, **but it also has a project that shows testing being done and the gathering of data.**

Examples of experiments can be: "The Effects of Detergent on the Growth of Plants", "Which Paper Towel is more Absorbant" or "What Structure can Withstand the Most Amount of Weight"

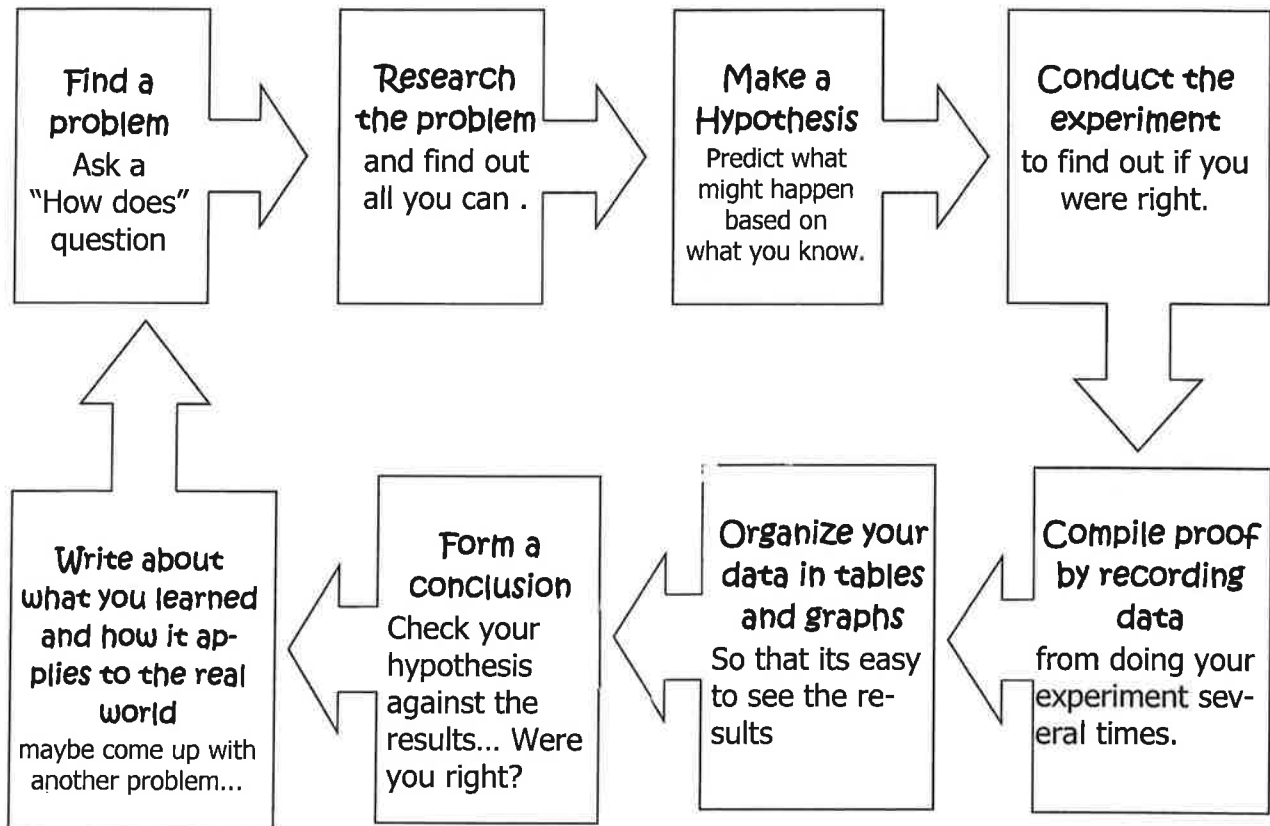

You can tell you have an experiment if you are testing something several times and changing a variable to see what will happens. We'll talk about variables later....

So What Type of Project Should You Do?

Even though you can learn a lot from building a model or display, we recommend that you do an **Experiment!!!** Why? Well, they are fun, they are more interesting and most of all, they take you through the **SCIENTIFIC METHOD**, which is the way real scientists investigate in real science labs. Besides that, the **scientific method** is what the judges are looking for!!

So What the Heck is the Scientific Method?

Choosing a Category that interests you...

All Great Projects start with great questions but before you get started on a great question you need to pick a subject or topic that you like. There are three different categories of the Science Fair to choose from. They are:

Life science: This category deals with all animal, plant and human body questions that you might have and want to do an experiment about. Remember that it is against Science Fair Rules to intentionally hurt an animal during an experiment. If you are dealing with animals, please let an adult assist you. It is okay to do experiment on plants, as long as they don't belong to someone else, like don't do an experiment on your mom's rose bushes unless you ask her first...

Life science also includes studying behaviors, so its a perfect category to try taste tests, opinion surveys, animal behavior training (or even training behavior in humans...like baby brothers or sisters...)

Physical Science: If you like trying to figure out how things work, then this is the category for you! It includes topics about matter and structure, as well as electricity, magnetism, sound, light or anything else that you might question, "How does it work and what if I do this to it, will it still work?" But remember, you always need to ask an adult first (and always make sure there is one of those adult guys with you when you try it.)

Physical Science also includes the composition of matter and how it reacts to each other. These are the science experiments that may have bubbling and oozing going on, like figuring out what is an acid and what is a base. It is a perfect category to try to mix things together to see what will happen. Again, if you are experimenting with possibly dangerous things, you need to recruit an adult to help you out.

Earth and Space Sciences: This category is really awesome because it covers all sorts of topics that deal with the Earth or objects in space. This includes studying weather, Geology (which is the study of everything that makes up the Earth, like rocks, fossils, volcanoes, etc..), and the study of all that is in space, including the stars, our sun and our planets. Unfortunately this topic is also where most kids mess up and do a collection or model project instead of an "Experiment," so be careful!!!

Now It's Your Turn:

Write down your favorite Science Fair Category and what it is you want to learn more about:

My favorite Category was _____
(Life Science, Physical Science, Earth and Space Science)
I want to do an experiment involving

Step 1: Coming up with a Good Question...

Now that you have picked out a topic that you like and that you are interested in, it's time to write a question or identify a problem within that topic. To give you an idea of what we mean you can start off by filling in the question blanks with the following list of words:

The Effect Question:

What is the effect of _____ **on** _____?

sunlight	on the growth of plants
eye color	pupil dialation
brands of soda	a piece of meat
temperature	the size of a balloon
oil	a ramp

The How Does Affect Question:

How does the _____ **affect** _____?

color of light	the growth of plants
humidity	the growth of fungi
color of a material	its absorbtion of heat

The Which/What and Verb Question

Which/What _____ **(verb)** _____?

paper towel	is	most absorbent
foods	do	meal worms prefer
detergent	makes	the most bubbles
paper towel	is	strongest
peanut butter	tastes	the best

Now its your turn:

Create your Science Fair question using either the "Effect Question", the "How does Affect Question" or the "Which/What and Verb Question":

Step 2 : Doing the Research and forming a Hypothesis

So you've picked your category and you've chosen a topic. You even wrote a question using our cool fill in the blank template. Now it is time to research your problem as much as possible. Becoming an expert at your topic is what real scientists do in real labs.

So How do you become an expert?

YOU READ!!!!

READ about your topic. READ encyclopedias. READ magazine articles and books from the library. READ articles from the internet. Take note of any new science words you learn and use them. It makes you sound more like a real scientist. Keep Track of all the books and articles you read. You'll need that list for later.

YOU DISCUSS!!

Talk about it with your parents. Talk about it with your teachers. Talk about it with experts like Veterinarians, Doctors, Weathermen or others who work with the things you are studying. Sometimes websites will give you e-mail addresses to experts who can answer questions.... But again, do not write to anyone on the internet without letting an adult supervise it. (*hint: take pictures of yourself interviewing people)

Whew.....

Then when you think that you can't possibly learn anymore and the information just keeps repeating itself.. You are ready to...

Write a Hypothesis

Now it is the time to PREDICT what you think will happen if you test your problem. This type of "SMART GUESS" or PREDICTION is what real scientists call A HYPOTHESIS. Using this fancy word will amaze your friends and will have you thinking like a full fledged scientist.

So how do you begin? Well, just answer this very simple question:

What do you think will happen, (even before you start your experiment)?

Example Problem:

Which Paper Towel is more absorbent?

Example Hypothesis:

I think Brand X will be more absorbent because it's a more popular brand, it is thicker and the people I interviewed said that the more expensive brands would work better

(This hypothesis not only predicts what will happen in the experiment, but also shows that the "Scientist" used research to back up his prediction.)

Now its your turn:

Write down the problem and create a Hypothesis based on what you have researched.

Problem: _____

Research: My problem is about this subject: _____
 (sample topics could be magnetism, electricity, buoyancy, absorbency, taste, plant growth, simple machines or other scientific topics that relate to your problem. If you are having problems finding out what the topic is, ask your teacher or an adult to help you on this one....)

Books I found in the library on my topic are:

Title:	Author:
_____	_____
_____	_____
_____	_____

Internet sites that I found on my topic are:

People I talked to about my topic are:

Some important points that I learned about my topic are

- _____
- _____
- _____
- _____

Hypothesis: I think that _____
 (will happen) because (my research shows...) _____

Step 3: Testing your Hypothesis by doing an experiment

Now we've come to the good part. The part that all scientists can't wait to get their grubby little hands on... you guessed it... The EXPERIMENT!

Designing an experiment is really cool because you get to use your imagination to come up with a test for your problem, and most of all, you get to prove (or disprove) your Hypothesis. **Now Science Fair Rules state that you cannot perform your experiment live, so you'll have to take plenty of pictures as you go through these seven very simple steps.**

First: Gather up your materials. What will you need to perform your experiment? The safest way to do this is get that adult you recruited to help you get the stuff you need. Oh, did we mention to take pictures or draw pictures of your materials. This will come in handy when you are making your board display.

Second: Write a PROCEDURE. A procedure is a list of steps that you did to perform an experiment. Why do you need to write it down? Well it's like giving someone a recipe to your favorite dish. If they want to try it, they can follow your steps to test if it's true. Scientists do this so that people will believe that they did the experiment and also to let other people test what they found out. Did we mention to take pictures of yourself doing the steps?

Third: Identify your variables. The variables are any factors that can change in an experiment. Remember that when you are testing your experiment you should only **test one variable at a time** in order to get accurate results. In other words, if you want to test the affect that water has on plant growth, then all the plants you test should be in the same conditions, these are called **controlled variables**: same type of dirt, same type of plant, same type of location, same amount of sunlight, etc. The only variable you would change from plant to plant would be the amount of water it received. This is called the **independent or manipulated variable**. The independent variable is the factor you are testing. The results of the test that you do are called the **dependent or responding variables**. The responding variable is what happens as a result of your test. Knowing what your variables are is very important because if you don't know them you won't be able to collect your data or read your results.

Fourth: TEST, TEST, TEST. Remember that the judges expect your results to be consistent in order to be a good experiment, in other words, when you cook from a recipe you expect the outcomes to be the same if you followed the directions (or procedure) step by step. So that means you need to do the experiment more than once in order to test it properly. We recommend five times or more. More is better! Don't forget to take pictures of the science project being done and the results.

Fifth: Collect your DATA. This means write down or record the results of the experiment every time you test it. Be sure You also need to organize it in a way that it is easy to read the results. Most scientists use tables, graphs and other organizers to show their results. Organizing makes the results easy to read, and much easier to recognize patterns that might be occurring in your results. (Besides, it impresses the judges when you use them.) But don't make a graph or table because we asked you to, use it to benefit your project and to help you make sense of the results. There is nothing worse than having graphs and tables that have nothing to do with answering the question of a science project.

Time out: How Do You Collect Data?!?

- **Keep a science journal:** A science journal is a type of science diary that you can keep especially if your experiment is taking place over a long period of time. We suggest you do that if your experiment is over a period of a week or more. In your journal you can record observations, collect research, draw and diagram pictures and jot down any additional questions you might have for later.
- **Have the right tools to do the job:** make sure you have the stuff you need to take accurate measurements like rulers, meter tapes, thermometers, graduated cylinders or measuring cups that measure volume. The recommended standard of measurement in science is metric so if you can keep your measurements in meters, liters, Celsius, grams, etc, you are doing great!
- **Tables, charts and diagrams** are generally the way a good scientist like you would keep track of your experiment trials. Remember you are testing at least 5 times or more. A table is organized in columns and rows and **ALWAYS** has labels or headings telling what the columns or rows mean. You will probably need a row for every time you did the experiment and a column telling what the independent variable was (what you tested) and the responding variable (the result that happened because of the independent variable)
- **Be accurate and neat!** When you are writing your tables and charts please make sure that you record your data in the correct column or row, that you write neatly, and most of all that you record your data as soon as you collect it **SO YOU DON'T FORGET WHAT HAPPENED!!!!** Sometimes an experiment might be hard to explain with just a table, so if you have to draw and label a diagram (or picture) to explain what happened, it is recommended that you do.
- **Use the right graph for your experiment.** There is nothing worse than a bad graph. There are all types of graph designs, but these seem to be easy to use for science fair experiments.

Plant	Amount of water per day	Size it grew in two weeks
(controlled variable)	(independent variable)	(responding variable)
Plant A	none	.5 cm
Plant B	5 ml	2 cm
Plant C	10 ml	5 cm
Plant D	20 ml	7 cm

- **Pie graphs** are good to use if you are showing percentages of groups. Remember that you can't have more than 100% and all the pieces need to add up to 100%. This type of graph is great if you are doing surveys

- **Bar graphs** are good to use if you are comparing amounts of things because the bars show those amounts in an easy to read way. This way the judges will be able to tell your results at a glance. Usually the bars go up and down. The x axis (or horizontal axis) is where you label what is being measured, (like plant A, B, C and D) and the y axis (or vertical axis) is labeled to show the unit being measured (in this case it would be centimeters that the plant grew)

- **Line graphs** are good to use if you are showing how changes occurred in your experiments over time. In this particular case you would be using the x axis to show the time increments (minutes, hours, days, weeks, months) and then you would use the Y axis to show what you were measuring at that point in time.

....And Now back to the Experiment Steps

Sixth: Write a Conclusion: tell us what happened. Was your hypothesis right or wrong or neither? Were you successful, did it turn out okay? Would you change anything about the experiment or are you curious about something else now that you've completed your experiment. And most of all, **TELL WHAT YOU LEARNED FROM DOING THIS.**

Seventh: Understand its Application. Write about how this experiment can be used in a real life situation. Why was it important to know about it?

Now it's your turn

Materials: (take pictures!)

List the Materials that you will need for your science experiment here:

- | | |
|----------|-----------|
| 1. _____ | 6. _____ |
| 2. _____ | 7. _____ |
| 3. _____ | 8. _____ |
| 4. _____ | 9. _____ |
| 5. _____ | 10. _____ |

Variables:

List the variables that you will control, the variable that you will change and the variables that will be the results of your experiment:

My controlled variables are (the stuff that will always stay the same): _____

My independent variable is (this is the thing that changes from one experiment to the next, it is what you are testing): _____

My responding variables might be (in other words, the results of the experiment)

Procedure: (the steps.... Don't forget to take pictures)

List the steps that you have to do in order to perform the experiment here:

- 1st.... _____
- 2nd _____
- 3rd _____
- 4th _____
- 5th.... _____
- _____
- _____
- _____

Design a table or chart here to collect your information

(Did we mention that you needed to take pictures of you doing the actual experiment?)

Use the Graph paper at the end of this booklet to make a graph of your results from your table.

Conclusion:

Now tell us what you learned from this and if you were able to prove your hypothesis. Did it work? Why did it work or why didn't it work? What did the results tell you? Sometimes not being able to prove a hypothesis is important because you still proved something. What did you prove?

Application:

(How does this apply to real life?)

Its important to know about this experiment because.....

Step 4: The Presentation or Why you needed all those pictures....

But First, a school Fable....

Sammy and Sally both baked cakes for the bake sale with the same cake mix and by following the same directions. When Sammy got his cake out of the oven, he carefully took it out of the pan, smoothed the chocolate frosting neatly and decorated his cake so that it looked delicious. Sally on the other hand, smashed her cake slightly when getting it out of the pan and globbed the frosting on parts of the cake. As you may have already guessed, everyone wanted some of Sammy's cake and no one wanted Sally's. Sally couldn't figure out why, because she tasted both and they both tasted the same...

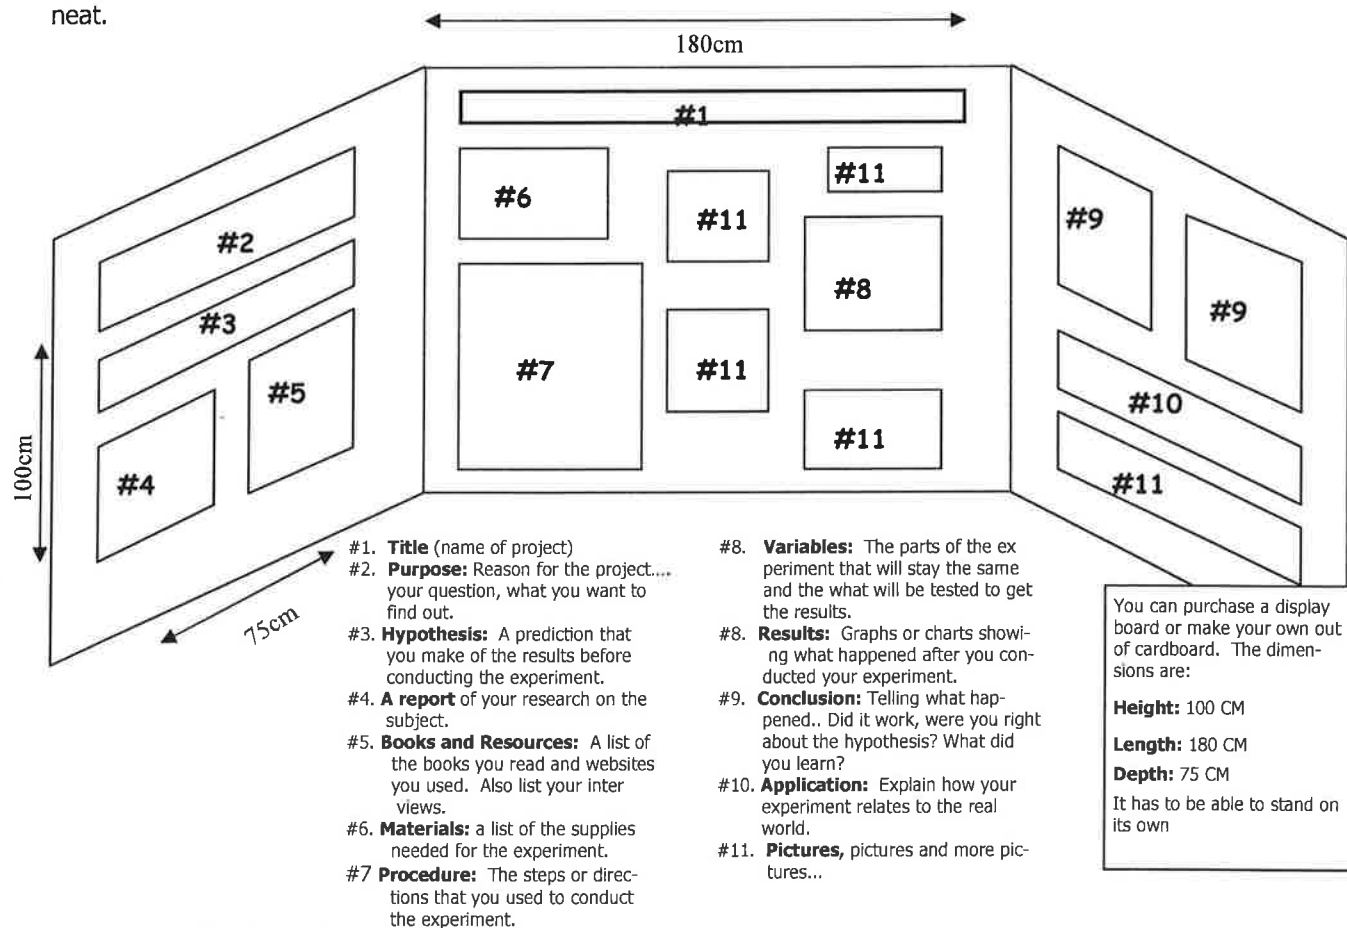

A good display is a Piece o'cake

You may have become the leading expert of your topic and had the most interesting experiment results, but if you don't make your science project look delicious for the judges eyes to see, well, your chances of winning sweepstakes will crumble like Sally's cake. Your display board is kind of like an advertisement for all your hard work. So take our advice: **BE NEAT!!** The judges like to see a nice, easy to read display, that has neat writing, easy to read graphs and tables and you guessed it... lots and lots of pictures!! (Did you remember to take pictures?)

MAKING A MOUTH WATERING DISPLAY

This is an example of a neat looking Science Fair Display Board. It is just an example. Depending on your information and the amount pictures, tables and graphs, you may have a different layout. Just make sure it is neat.

Display Beauty Secrets:

- Use a computer to type out your information, but if you can't, write out your information in your best writing. Printing the titles is usually best. If you are using a computer, make sure the fonts are readable and only use one or two type faces.
- Use spray adhesive or glue stick to paste up your papers. It is less messy
- Mount white paper, pictures, graphs and tables on colored papers (making sure the colored paper is larger so it creates a border for the white paper.) Do not

Colored paper
Creates border

White paper, pictures
or graph/tables

Science Fair PowerPoint Presentation Template

Your Presentation must have the following headers which represents each slide.

1. Introduction/Opening Slide

(Project Title and Student Name(s))

2. Topic Category/Problem Statement Slide

Type your question here. (This is the question that your experiment answers.)

Ex: Does organic or regular soil make plants grow faster?

3. Project Overview Slide

Type a brief summary (short and concise narrative) of your project here. Why did this topic

interest you? (4-6 sentences long)

4. Research Slide

(What sources did you use for your research? Internet, books, magazines, articles, etc.) Summarize your research here in **three to five bullet points (minimum) is (3):**

- Science Buddies (example)
- Science World Magazine
- 3rd bullet point

5. Hypothesis Slide Example:

IF I use *organic soil* in my flower garden, **THEN**, the flowers will grow *taller*.

6. Materials Slide

Materials

Type a detailed list of the items you needed to complete your experiments.

Example:

- 1 gallon of XYZ (*this in the name of the soil*) organic soil
- 1 cup of ABC fertilizer
- 1 teaspoon of growth hormone

7. Procedures Slide (may take a few more slides)

1. List **all of the steps** (like if you were following a cooking recipe) to be used in completing your experiment.
2. Remember to **NUMBER** your steps.
3. **Add photos** of your experiments. Remember to caption your photos.
4. **DO NOT** use **one** procedure for each slide!

8. Data/Observation Slide

This slide will be a brief summary/narrative of your observations.

- It is easier to understand the data if it is put into a **table or graph**. You can create data table using Microsoft Excel and import to PowerPoint. In the next two slides insert your data table(s) & graph(s)
- Make sure all **data is clearly labeled**. Identify/label **your (x,y) axis**; tile your data tables & graphs.
- You can also **insert photos here**. Remember to caption them.

9. Data Table Slide

10. Graph Slide

11. Conclusion

Type a brief summary here of what you discovered based on the results of your experiments. **You need to indicate whether or not the data supports the hypothesis and explain why or why not.** Was your hypothesis TRUE or FALSE?

Your presentation may be anywhere between 20-25 slides. You will have up to 4 minutes to present your science fair project presentation to the class and to me. PRACTICE, PRACTICE, PRACTICE!!!

PowerPoint Do's & Don'ts

- Do **NOT** use a **Font Size** smaller than a 28.
- I will **ONLY allow Procedures** to be a font size of no smaller than **20**. The only **font types** I will allow are the following: Times New Roman, Century Gothic, Arial, and **Comic Sans MS**
- Do bullet your information and keep it concise as possible.
- Do keep slide animation & transitions to a minimal. (Too much can become distracting)
- Do add music, videos, data tables, graphs and pictures to your presentation. Make sure it is relevant to your topic. **Music may be used in the introductory slide/opening slide (Just a few seconds of music). Videos –no more than 1 minute.**
- Do get creative with your background design.
- Don't use a **font color** that will not be visible to with your background. Stay away from dark backgrounds using **RED** as your font color. Only use **RED** to make a point about something or error in your project.
- Do check your grammar and spelling. Have your parents, older siblings, friends and others take a look at your presentation for mistakes.
- Be consistent with your headers & alignment (justification).
- Do use *Italics*, Underline and **BOLD** when you want to make a point or identify something important!
- Don't make your slides cluttered and busy with too many clipart images, pictures, etc.
- Do practice presenting in front of people so you become comfortable speaking in public.
- Don't give your back to the audience when presenting and speak loud, clear and with confidence.
- Do have eye contact with your audience.

Environmental Science Fair Projects: 30 Eco Friendly Ideas

Water Science Fair Projects:

1. How does the water cycle work? [Create a working model]
2. Where does fresh water come from?
3. How do we clean dirty water to make it clean enough to drink? [Demonstrate different filtering techniques.]
4. Why is water scarce in parts of the world and who is most affected?
5. What are the main culprits of water contamination?
6. What are water-borne diseases and how do they affect public health?

Air Quality Science Fair Projects:

7. How does polluted air affect human health? [Show the effect of pollutants on the respiratory system.]
8. How does transportation affect air quality?

Climate Change Science Fair Projects:

9. What is the greenhouse effect? [Create a model]
10. How do certain human activities contribute to global warming?
11. What do ice core samples tell us about the history of global temperatures?
12. How does climate change affect the habitats and migration patterns of different species?
13. What are the consequences of global sea level rise? [Map the effects of various sea level increases, showing where impacts occur.]

Biodiversity Science Fair Projects:

14. What are invasive species and why might they pose a threat to different ecosystems?
15. How have we derived medicines from different plants and animals?
16. What are the major threats to biodiversity?

Agricultural Science Fair Projects:

17. What are the pros and cons of genetically modified foods (GMOs)?
18. Can we feed the world with organically grown foods?
19. What are the short and long-term effects of commercial fertilizer use on the land?
20. What sort of diet would be optimal for human health and the environment? [Calculate the ecological footprint of various diets.]
21. Has the amount of arable land changed over time and how might this help predict future cropland availability?
22. How might climate change affect crop yields in different parts of the globe?

Renewable Energy Science Fair Projects:

- 23. How do solar panels work? How about wind turbines?
- 24. What is geothermal energy and how is it used?

Solid Waste Recycling Science Fair Projects:

- 25. Which materials decompose the fastest in landfills
- 26. Paper vs. Plastic – Which kind of bag has the greater impact on the environment and why?
- 27. How can changes in daily habits change the amount of trash we create?

Population Themed Science Fair Projects:

- 28. What is carrying capacity in nature and what happens when different species exceed the carrying capacity?
 - 29. How does reproduction vary among different species (ex. number of offspring, length of gestation, mating habits)?
 - 30. How and why did human settlements change over time and what effect have these changes had on ecosystems?
-
